### Proposal Description:

The objective of this project is to create a braille input device allowing those with visual impairments to type on to a screen. The braille language itself is a set of six raised dots in two parallel rows each having three dots. **[1]** Possible combinations of these dots correspond to different letters/symbols. To emulate this system, we will solder 6 buttons on to the pins of our Onion Omega 2, where each key corresponds to one dot of the Braille script. 2 additional buttons will represent the space and back space button on a typical key board.

Each time a user presses a button(s) and then presses the enter button, the Omega board will return a binary code. For example, if button 1 on the first row is pressed, then the onion board will return 100000. Our code will then decrypt the input value by calling a function that will pass the input value through a 2-d array which will already contain all the possible input combinations and their respective values. If the users input does correspond to a value, then a letter/number will appear on the Onion LCD screen, else there will be no output.

Figure 1: Sketch of proposed design

This device could be used as a keyboard by individuals with visual impairments and would assist them in typing without having to learn anything else. It also provides a cheaper alternative to the typical braille keyboard cost thousands of dollars. **[2]**

### Equipment Requested:

Item	Justification	Where to purchase	Cost (CAD\$)
Onion Omega	Main component of desgin, tacks button input and sends information to code to be processed	N/A	0
LCD screen (OLED expansion)	Displays the letter/number that the user inputs into the braille buttons	Onion Online store	15.44

10 Buttons	Emulated the braille dots; allows user to input letters/numbers	Creaton Inc , Toronto	\$0.30 * 10 = \$3.00
40 Jump wire (100 mm , male-to-male)	Create circuit that will allow button input to be detected	RigidWare @uWaterloo	\$0.15* 40= \$6.00
Breadboard	To create circuit connecting push buttons to onion omega	RigidWare @uWaterloo	\$8.00
10 200 ohms resistor	to control the amount of current flowing into the circuit	RigidWare @uWaterloo	\$0.15*10 = \$1.50

**Total cost: \$23.94**

**Necessary Delivery Time:** For the equipment that can be bought at waterloo, we are hoping to get those by the end of this week (10/11/17). As for the buttons we will need them sometime between 13/11/17 to 17/11/17. Since the LCD screen will be ordered off the Onion Online store, we are expecting a two week delay and hoping to get them 20/11/17 to 24/11/17.
